## Çalışma

- 1 . ELDER-TURK study, Objective: Heart failure (HF) has a high prevalence and mortality rate in elderly patients however, there are few studies that have focused onpatients older than 80 years. The aim of this study is to describe and compare the age-specific demographics and clinical features of Turkishelderly patients with HF who were admitted to cardiology clinics.Methods: The Epidemiology of Cardiovascular Disease in Elderly Turkish population (ELDER-TURK) study was conducted in 73 centers in Turkey, and it recruited a total of 5694 patients aged 65 years or older. In this study, the clinical profile of the patients who were aged 80 years or older and those between 65 and 79 years with HF were described and compared based on the ejection fraction (EF)-related classification: HFrEF and HFpEF (is considered as EF: ≥50).Results: A total of 1098 patients (male, 47.5 mean age, 83.5±3.1 years) aged ≥80 years and 4596 patients (male, 50.2 mean age, 71.1±4.31 years) aged 65-79 years were enrolled in this study. The prevalence of HF was 39.8 for patients who were ≥80 years and 27.1 for patients 65-79 years old. For patients aged ≥80 years with HF, the prevalence rate was 67 for hypertension (HT), 25.6 for diabetes mellitus (DM), 54.3 for coronary artery disease (CAD), and 42.3 for atrial fibrillation. Female proportion was lower in the HFrEF group (p=0.019). The prevalence of HT and DM was higher in the HFpEF group (p0.01), whereas CAD had a higher prevalence in the HFrEF group (p=0.02). Among patients aged 65-79 years, 43.9 (548) had HFpEF, and 56.1 (700) had HFrEF. In this group of patients aged 65-79 years with HFrEF, the prevalence of DM was significantly higher than in patients aged ≥80 years with HFrEF (p0.01).Conclusion: HF is common in elderly Turkish population, and its frequency increases significantly with age. Females, diabetics, and hypertensives are more likely to have HFpEF, whereas CAD patients are more likely to have HFrEF., Türkiye’de 73 merkez, Çalışma, 01/03/2015-31/12/2015, (Ulusal)

- 
- 2 . QUALIFY global survey, Aims: To assess physicians' adherence to guideline-recommended medications for the treatment of chronic heart failure (CHF) with reduced ejection fraction. Methods and results: QUALIFY is an international prospective observational longitudinal survey of 7092 CHF outpatients recruited 1–15 months after hospitalization for heart failure from September 2013 to December 2014 in 547 centres in 36 countries. We constructed a five-class guideline adherence score for angiotensin converting enzyme inhibitors (ACEIs), beta-blockers, angiotensin receptor blockers (ARBs), mineralocorticoid receptor antagonists, and ivabradine. The adherence score was good in 67, moderate in 25, and poor in 8 of patients. Adherence was lower in women than men but there were differences in age (65.7±12.5 years women vs. 62.2±12.4 years men, P 0.001) and the proportion of women at ≥50 target dose of beta-blockers was lower in those ≥67 years (median) (11 vs. 16.2, P =0.005). Geographic variations were observed with lower adherence scores in Central/Eastern European countries. The proportion of patients at target dose and ≥50 of target dose was low (27.9 and 63.3 for ACEIs, 14.8 and 51.8 for beta-blockers, 6.9 and 39.5 for ARBs, and 6.9 and 39.5 for ivabradine, respectively). It was also lower in patients most recently hospitalized (6 vs. ≥6 months) except for beta blockers. Conclusion: This international survey shows that adherence to guideline-recommended medications is relatively satisfactory but the dosage of recommended CHF medications is usually suboptimal. Action plans aimed at improving adherence to guidelines are required., 36 ülkeden 547 merkez katılmıştır. Fransa,Almanya, Yunanistan, italya, polan merkez yürütücüler olup Türkiyede çalışmanın yürütüldüğü ülkeler arasındadır., Çalışma, 01/09/2013-31/12/2014, (Uluslararası)
